More safety with Sievi MGuard

The design of Sievi MGuard Roller shoes started with the idea of developing comfortable footwear that provides the user with additional protection in all conditions. The flexible FlexEnergy component in the heel, the BOA® Fit System and the flexible TractionPro rubber friction sole with great grip take the footwear to a new level of comfort. A new feature in the MGuard Roller shoe is the integrated Metashield metatarsal guard, which protects the user from impacts on the insteps.

Metashield metatarsal guard

MGuard Roller shoes feature the thin and very flexible Metashield metatarsal guard developed by Sievi. It is integrated in the shoe's structure and absorbs impacts on the instep by up to 90 percent. The metatarsal guard is made of PORON XRD® material, and its molecular structure together with the shoe's breathable upper material allow air to circulate and remove moisture from the shoe, making it very pleasant to wear. The Metashield metatarsal guard offers significantly better protection than conventional safety shoes, without compromising comfort.

Sievi's new MGuard Roller shoes with integrated metatarsal guard offer enhanced protection without compromising wearer comfort, and they are suitable for even the toughest of conditions.
