

Instruction manual

WIRELESS DC TOOL COM Protocol MODBUS BM/BMT series

IMPORTANT

The tool delivered with this manual may have been modified for specific needs.

In that case, please give us the tool code number written on our shipping note or the approximate tool delivery date when you place an order for a new similar tool or for spare parts.

In that way, you will be sure to get the required tool and/or spare part.

WARNING

This information has to be kept in a location known by all users.

Each operator has to read carefully this manual before installing, using, and mending the product.

Be sure that the operator has understood using recommendations and the meaning of signs put on the product.

Most accidents could be avoided respecting this Manual Instructions. As a matter of fact, they were created according to European laws and norms regarding products.

In each case, please respect and follow safety national norms. Do not take off nor damage the stickers or advise put on the product and above all the details imposed by the law.

1. Overview and Communication Specifications

1.1 Overview

BM is capable of connecting to the host controller (Handy Loader, HMI, PLC, PC, etc.) through Wifi & ethernet, allowing the user to use such functions as parameter change and data monitoring.

AP: WiFi Access Point or Router 2.4GHz or 5GHz (not included)

2. Basic Structure of Communication Protocol MODBUS TCP

2.1 Modbus TCP Frame Format

Name	Length(byte)	Function
Transaction	2	For synchronization between messages of server & client
Identifier		
Protocol	2	Zero for Modbus/TCP
Identifier		
Length Field	2	Number of remaining bytes in this frame
Unit	1	Slave Address (use 0)
Identifier		
Function	1	Function codes as in other variants
Data	n	Data as response or commands

Format of Modbus/TCP frame is described in the below figure.

MODBUS TCP Frame Structure

byte 0 ~ 1: transaction ID (Transaction Identification)

This means the sequence number of queries and responses. While TCP operates as a master, it is incremented by one in every query (It doesn't matter if this field is set to 0x0000).

- byte 2 ~ 3: protocol ID (Protocol Identification)

This means the protocol identification and the value is fixed as 0x0000 for Modbus/TCP

- byte 4 ~ 5: length

The value of this means the number of bytes from next byte of length field to the end of the frame.

- byte 6: unit ID(Unit Identification)
- byte 7: FC (Function Code)
- byte 8~: data depending on function code

Caution

A polling request should be sent to each BM/BMT tool every second to keep communication alive.

3. Function code & message details

Function code	Description	Remark
03 (0x03)	Read Holding Register	16bit data (Integer) ex) parameter
04 (0x04)	Read Input Register	16bit data ex) monitoring data
06 (0x06)	Write Single Register	16bit integer format ex) parameter data
17 (0x11)	Request Slave ID	

3.1 < READ > Function code 03 & 04 details

Function code 03 is used to read the register as like parameters (address 1 to 725) Function code 04 is used to read the register as like alarm & monitoring data (address 3100 to 3399). The only integer number is allowed.

[Query (Request)]

Slave address (00	Function Code	address	Start address	No of address	No of address
for TCP)		High	Low	High	Low

Function code consist of one byte. But start address and number of address are consisted by 2 bytes with 4 digits of hexadecimal, starting with first 2 digits for high number, second 2 digits for low number.

[OK Response]

Slave	Function	No of byte	Data #1	Data #1	x n data
address	Code		High	Low	
(00 for TCP)			_		

The number of data is consisted by 2 bytes with 4 digits of hexadecimal. So the total number of data is equal to 1/2 of the number of byte.

[Abnormal Respons]

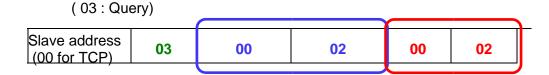

Slave address	Function code	Error code
(00 for TCP)	+0x080	Elloi code

By adding 0x080 to the function code, it response any abnormal or wrong message

Example message of " 03 " for parameter data

To read the data of parameter 1 and 2, which is torque & speed value of Preset #1

Start address: 2 (0002h)

Number of address: 2 (0002h)

Read data of two addresses starting from address #2

(03: Response)

Slave address	Function	No of byte	Data #1	Data #1	x n data
(00 for TCP)	Code		High	Low	

Slave address (00 for TCP)	03	04	01	0F	03	21
----------------------------------	----	----	----	----	----	----

Data value of 1st address : 010F (hex) = 271 (dec) ← torque value of Preset #1

Date value of 2nd address : 03E8(hex) = 1000 (dec) ← Torque limit value 10.00%

[Address for parameters]

Refer the appendix A for all address details for parameters

1 – 725 : Parameter address

(1001 – 1724 : Parameter value range MIN)

(2001 – 2724 : Parameter value range MAX)

Example message of " 04 " for fastening data

To read the fastening data which is renewed by the event such as start, stop, F/R rotation...

(04 : Query)

Slave address (00 for TCP)

00

00

00

00

00

00

Start address: 3204 (0c84h)

Number of address: 2 (0002h)

Read data of two addresses starting from address #3204

(04: Response)

Slave address	Function	No of byte	Data #1	Data #1	x n data
(00 for TCP)	Code		High	Low	

Slave address	04	04	01	0F	03	21
(00 for TCP)						

Data value of 1st address : 010Fh = 2.71 (dec) ← Converted torque value

Data value of 2nd address : 03E8h = 1000 (dec) ← Target speed

[Address for monitoring]

Refer the appendix A for all address details for monitoring

3100 - 3101 : Alarm data

3200 – 3213 : Data updated by event (Start, F/L, Preset change, Torque up)

3300 - 3313 : Real-time data

3.2 < WRITE > Function code 06 : writing parameters

Function code 06 is used to WRITE the parameter value in each register. The only integer number is allowed.

(Query)

Slave address	Function	Address	Address	Date	Data
(00 for TCP)	Code	High	Low	High	Low

(OK Response)

Slave address	Function	Address	Address	Date	Data
(00 for TCP)	Code	High	Low	High	Low

It provides the echo response on the query (request) after writing data in register.

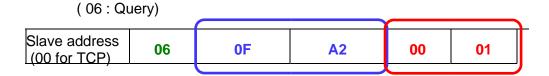

- Refer the appendix A for all address details for writing.

4000 – 4005 : remote inputs (preset selection, remote start, driver lock, F/L, alarm reset)

Example message of "06 " for Real-time monitoring data Auto output → ON

To read the renewed fastening data automatically and continuously, repeat the same query as below in every 10 seconds.

Address: 4002 (OFA2h)

Data: 1 (0001h)

(06: Response)

It response the same as the query

01	06	٥F	A2	UU	U 1

Once it write "1" on the address 4002, the real-time monitoring data is responsed with the function code "04" automatically when there is the event as like torque-up, F/R change, preset # change, etc.

Repeat the same query in every 10 seconds to keep the data output.

3.3 Auto data output - data description

Auto data output is same data format as the answer to a read request (code 04) of 14 register addresses 3200 to 3213 but sent spontaneously without read request when a new event occurs

Data description:

	Preset no.	3202
	Target torque (* x 100)	3203
	Converted torque (* x 100)	3204
	Target speed (rpm)	3205
	A1 (degree)	3206
	A2 (degree)	3207
Data	A3 (degree)	3208
updated on	Screw count value	3209
events (Start, F/L, Preset, Torque up) Error Forward / Loos Status	7.02-3	3210 3211
	Status	3212
	Snug torque angle (degree)	3213

Read : 0x04	
Read: 0x04	
Read: 0x04	
Read: 0x04	[value: 4321] -> [mean: 43.21]
Read: 0x04	
Read : 0x04	
Read: 0x04	
Read: 0x04	
Read: 0x04	
Read: 0x04	
Read : 0x04	
Read: 0x04	0: Forward, 1: Loosening
Read : 0x04	Other = 0, Fastening complete = 1, Fastening NG [E330,332,333,334,335,336,337,338,339]= 2, F/L change = 3, Preset change = 4, Alarm reset = 5, Error(except fastening NG) = 6 Barcode = 7 Screw count-1 = 8
Read : 0x04	Section States 2 - 5
neau . UXU4	

Event generating an auto data output for any of the following status:

0 = Other

1 = Fastening complete

2 = Fastening NG (E330,332,333,334,335,336,337,338,339)

3 = F/L change

4 = Preset change

5 = Alarm reset

6 = Error(except fastening NG)

7 = Barcode (not implemented)

8 = Screw count-1

Example of auto data output frame:

Auto data frame explanation:

00 01 : transmission ID 00 00 : protocol ID

00 1F: length in bytes (31 in bytes)

00 : unit

04 : modbus function code (read)
1C: number of bytes (28 in dec)
00 : data registers 3200 to 3213

3.4 < REQUEST > Function code 17 : Slave device information

Function code 17 is used to read the slave device information about ID no, controller model, screwdriver model, serial no and firmware version.

Information

This request can be used for keep alive polling with tool. Suggested frequency: 1 second

(Query)

Slave address	Function	CRC (RTU)	CRC (RTU)
(00 for TCP)	Code (17)	Low	High

(Response)

Slave	Function	No.	D	ID	Controller	Controller	Screw	Screw	Ver.	Ver.	S/N	S/N	S/N	S/N	CRC	CRC
address	Code	of	High	Low	model	model	driver	driver	High	Low	4	3	2	1	(RTU)	(RTU)
(00 for		byte			High	Low	model	model							Low	High
TCP)							High	Low								

BM

Value	Model
0	Unknown
1	3201
2	3202

×	-:

BMT

Value	Model
0	Unknown
1	3201
2	3202
3	3204
4	3206
5	3211
6	3216
7	3224
8	3236
9	3245
10	3264
11	3280
×	.:i

Software version (controller firmware version)

Version = (Version high << 8) + (Version low)

Serial no (driver serial number)

Serial no = (sn4 << 24) + (sn3 << 16) + (sn2 << 8) + sn1

3.5 Error code for abnormal response

If there are wrong function code or communication failure by protocol (parity, LRC, CRC..etc.), there will be no response. The master will show "TIME OUT" error.

If the query contains wrong function code or address, the function code + 0x80 will be responsed together with the following error code in data registry.

	<u> </u>				
Error code	Description				
0x01	No defined function code or wrong function code				
0x02	Wrong address or no existing address				
0x03	Data length over the capacity				
0x07	Wrong CRC value in query				
0x0C	Over the number of byte				
0x0E	Range of data is not available				

Example message

To read the 5 parameter data starting from 564 to 568

(01: Query)

Slave address (00 for TCP)	01	02	34	00	05
,					

Start address: 564 (0234h), Number of address: 5 (0005h)

Function code 01 is not defined. → Function code error

Parameter from 564 to 568 are not existing. → No existing address

(01 + 80 : Response)

Slave address (00 for TCP)	81	02
----------------------------------	----	----

Function code (01) + 0x80 = 81

Error code for wrong data address = 02

4. Appendix A

4.1 Parameter factory setting, Address and Function code details for BM Please refer 60451 datasheet

4.2 Parameter factory setting, Address and Function code details for BMT Please refer 60452 datasheet
